

61
a gas source delivering a flow of air/oxygen at a rate of approximately 4 to 40 liters per minute through the delivery tube and nasal catheter into the patient's distal nasopharynx or oropharynx.--

Please amend claim 15 as follows:

sub 2
-15. (twice amended) A nasopharyngeal catheter to deliver a flow of air/oxygen into a patient's distal nasopharynx or oropharynx to supplement a patient's spontaneous respiration, said nasopharyngeal catheter comprising:

a nasal catheter having a proximal end and a distal end adapted to extend through a patient's nose and into the patient's distal nasopharynx or oropharynx without obstructing the patient's spontaneous respiration, said catheter being made of a flexible material that can be trimmed to a desired length;

a delivery tube adapted to extend below the patient's nostril having a connector for removable attachment to the proximal end of the nasal catheter; and

a gas source delivering a flow rate of approximately 4 to 40 liters per minute through the delivery tube and nasal catheter into the patient's distal nasopharynx or oropharynx.--

Please amend claim 23 as follows:

sub 3
-23. (amended) A method for providing a supplemental flow of air/oxygen to a spontaneously breathing patient, the method comprising:

advancing a nasopharyngeal catheter through a patient's nostril until the distal tip of the catheter is located in the patient's distal nasopharynx or oropharynx without obstructing the patient's spontaneous respiration; and

supplying air/oxygen through the catheter at a flow rate of approximately 4 to 40 liters per minute into the patient's distal nasopharynx or oropharynx.--
